

Acknowledgements

I would like to thank some of the people who made this work possible, feasible and pleasurable in rough order of appearance in my life.

To my family for being my family and for being there.

To Sören, Jörgen, Ante, Jonas, Christer and Robert for teaching me how to think and argue during those all-night marathon discussions in Uppsala.

To those authors whose articles and books have intrigued, provoked, reached out, seized and shook me, and who have changed my understanding through on-going internalized conversations throughout the years. Campbell was probably the first¹.

To Lars, Kia, Jussi and Jacob for unaware role modeling, thus channeling my curiosity into the structure of scientific inquiries.

To professors Yvonne Wærn and Lars-Christer Hydén, my two advisors at the Department of Communication Studies, Linköping University, for moral support and encouragement and for constantly urging me to look at the big picture and the interesting/difficult questions within that picture when I got stuck.

To my colleagues at the Department of Communications Studies and especially to Henrik and Christer in the Human-Centered Information Technology group (HIT) for friendship, in-depth discussions and critical distance to it all.

To the SvenskMud magicians for their openness and for allowing and even encouraging me to study SvenskMud, and for helping me when asked – despite the fact that programming is more interesting than *talking* about programming.

To Tessa for her support and help, especially in overcoming initial inertia and working up supersonic speed during the last year.

To the Royal library in Stockholm for providing an excellent environment in which to write a Ph.D. thesis.

To professor Ralph Schroeder of Chalmers University and the other participants at my “final seminar” in May 2000 for opening doors and urging me to select one of several possible tracks. Thanks for pushing, I might have surprised you with my selection.

¹ Campbell, J. (1982). *Grammatical man: Information, entropy, language and life*. New York: Touchstone/Simon & Schuster.

To all those near and dear that I have neglected because of my research and my thesis during the second half of the previous decade. Sorry for selecting books as company and for being nerdish and introvert too many times (you know that's not me). I'll work with retroactive reactive effect compensation and try to make it up!

Finally I would like to thank Amy Bruckman and Pavel Curtis and especially the still-unknown person at the Swedish Institute of Computer Science (SICS) who printed their papers and left them by the printer long enough for me to copy them on that fateful day in 1993 when I first learned about muds.

Stockholm, November 2000

Daniel Pargman
